

ABOUT CYBERWISER ESSENTIAL

CyberWISER Essential is a complete service that incorporates a decisive feature brought by WISER: the real-time monitoring and assessment of cyber risk.

CyberWISER Essential requires a set of sensors to be deployed on the target infrastructure to be assessed and it enhances the vulnerability scan feature to provide a complete testing module. The service combines the information obtained from the monitoring and testing module with the client profile information collected in the configuration module, in order to provide a comprehensive evaluation of the cyber risk, based on both technical and business aspects.

Who is the service designed for?

The quantification of the social and economic impact of risk allows technical information such as alerts on security, to be transformed into key business information. This novel approach allows non-technical managers such as CEOs, Financial managers, Operations managers, to make an informed decision about the resources to be deployed to mitigate a potential attack. In this way, the final service provided to customers does not only consist in detection of risk, but provides information that helps to assess the risk in terms of potential economic loss, and the resources necessary to avert such risk.
