

ABOUT CYBERWISER PLUS

CyberWISER Plus is the most complex and advanced mode of operation designed for the WISER Platform.

The WISER sensors catalogue is extended with the inclusion of sensors able to collect information at the application layer level. This means that the quantity and variety of data available for processing and analysis is larger. CyberWISER Plus offers the possibility to put customized sensors tailored to the peculiarities of the target infrastructure in place and also integrates the existing sensors provided to the customers. The full support of the WISER team is included. CyberWISER Plus is not limited to suggesting mitigation measures, it also offers cost-benefit analysis features allowing informed decisions to be made on the best mitigation measures to apply, by ranking and prioritizing them.

Who is the service designed for?

Many small as well as large companies lack the knowledge necessary to make informed critical decisions regarding cyber security. Given the fact that cyber security requires an investment which is often non negligible in the company's overall budget, CEOs or similar managing officers will always require this information in order to make these investments.

CyberWISER Plus makes a relevant contribution in helping to steer the company's cyber security policy, following a strategy based on a rigorous methodology, with contained financial costs, that pursues a "cyber-security for all" approach.
